Case Study 2 – A Static Environment

Diagram for the top level features of the feature model used by the company, as presented in the article, is given in Figure SM-1.

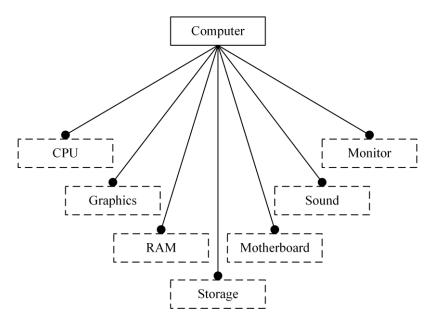

Fig. SM-1. Top level features of the computer parts feature model diagram.

The remainder of the model are depicted in Figures SM-2 to SM-8. Reader may note that some of the features have the same name (e.g., "7th G."). Feature names have been shortened for the sake of readability, the feature names in the actual model are unique.

Leaf features are numbered for presentation purposes. The complete list of these variants are given in Table SM-1. This table also includes the feature attributes and their values. Every variant has three attributes: *hw*, *price*, and *priceCat*. hw stores the stereotype for a feature, which is a string. price represents the price of a component in USD. priceCat denotes the price category for a component, an integer value in the interval [1, 5]. Some features have an additional attribute, *rating*, representing the rating points the component received from benchmark tests.

Pricing information and rating data are gathered from various websites (e.g., https://www.cpubenchmark.net) to create a realistic model. It must be noted that they do not represent official pricing or rating information. Rating data are normalized in order to establish performance categories among various component types.

Declarations for the features are included in the file Declarations.fm. Feather scripts for Branch A and Branch B are provided in the files Branch A. feat and Branch B. feat, respectively.
